

# Simple Friction Comparison (Maths vs Graphical)

Tuesday, 15 March 2011  
5:47 PM

Q4: (cont) A block of mass 2.1 kg rests on a horizontal table. The coefficient of friction is 0.2. What horizontal force F will start the block moving?

$$F_f = \mu F_n$$

Mathematically:

Coeff = 0.2, mass = 2.1

$F_n = 2.1 \times 9.81 = 20.601 \text{ N}$

$F_f = 0.2 \times F_n = 0.2 \times 20.601 = 4.1202 \text{ N}$

Graphically;

Angle of friction =  $\text{atan}(\text{coeff})$

$= \text{atan}(0.2) = 11.31 \text{ degs}$

Convert mass to N:  $2.1 \times 9.81 = 20.601 \text{ N}$

Measured on CAD

Pushing Force = 4.1202N

End Z	0
Delta X	4.1202
Delta Y	0
Delta Z	0
Length	4.1202
Angle	0

Q6: It took a force of  $F=108 \text{ N}$  to get this block moving. The coefficient of friction is 0.5. What was the mass of the block?

$$F_f = \mu F_n$$

Mathematically:

Coeff = 0.5, mass = ?, Force  $F_f = 108 \text{ N}$

$F_n = F_f / \text{coeff} = 108 / 0.5 = 216 \text{ N}$

So mass =  $216 / 9.81 = 22.0183 \text{ kg}$

$$F_f = \mu F_n$$

Mathematically:

Coeff = 0.5, mass = ?, Force  $F_f$  = 108N

$F_n = F_f / \text{coeff} = 108 / 0.5 = 216 \text{ N}$

So mass =  $216 / 9.81 = 22.0183 \text{ kg}$

Graphically;

Angle of friction =  $\text{atan}(\text{coeff})$

$= \text{atan}(0.5) = 26.565 \text{ degs}$

360 deg notation  $(90 + 26.565) = 116.565 \text{ degs}$

From CAD, weight force

$F_n = 216.0005 \text{ N}$

So mass =  $216.0005 / 9.81$

$= 22.0184 \text{ kg}$

**Q7: It took a force of  $F = 130 \text{ N}$  to get this  $55 \text{ kg}$  block moving. What is the coefficient of friction?**

Mathematically:

Coeff = ?, mass =  $55 \text{ kg}$ , Force  $F_f$  =  $130 \text{ N}$

$F_n = 55 * 9.81 = 539.55 \text{ N}$

Coeff =  $F_f / F_n = 130 / 539.55 = 0.2409$

Graphically;  
Solve using CAD, but find  
The angle last...

$$F_n = 539.55$$

Angle of friction force is  
103.547 degs (in 360 notation)  
So angle of friction =  
 $103.547 - 90 = 13.547$  degs  
So coeff =  $\tan(13.547)$   
= 0.24095

# Friction questions

Tuesday, 6 March 2012  
6:30 PM

Q10: Block A=31 kg, and Block B=36 kg. The coefficient of friction between all surfaces is 0.25. What force F will make block B slide?

$$F_f = \mu F_n$$

2 surfaces!

Top surface:

$$F_f = \mu F_n = 0.25 * (31 * 9.81) = 76.0275 \text{ N}$$

Bottom surface:

$$F_f = \mu F_n = 0.25 * ((31 + 36) * 9.81) = 164.3175 \text{ N}$$

$$\text{Total Force} = 76.0275 + 164.3175 = 240.345 \text{ N}$$

Q11: This joint relies only on friction. FORCE=1.17 kN and coefficient of friction between plates is 0.28. What tension is needed in the bolt?

$$F_f = \mu F_n$$

$$F_n = F_f / \mu$$

$$= 1170 / 0.28$$

$$= 4178.5714 \text{ N}$$

Q13: Force A=3220 N, angle B=54 degs, mass is 0.57 tonnes. What is the coefficient of friction?

Get Components - Parallel and Normal to surface.

Get Components - Parallel and Normal to surface.

$$A_x = A \cos(\theta) = 3220 * \cos(54) = 1892.669 \text{ N}$$

$$A_y = A \sin(\theta) = 3220 * \sin(54) = 2605.035 \text{ N}$$

$$W = mg = 570 * 9.81 = 5591.7 \text{ N}$$

$$F_f = \mu F_n$$

Need the NORMAL FORCE!

$$F_n = W - A_y = 5591.7 - 2605.035 = 2986.665 \text{ N}$$

$$F_f = \mu F_n, \text{ so } \mu = F_f / F_n$$

The friction force is the parallel force...

$$F_f = 1892.669 \text{ N}$$

$$\text{So, } \mu = F_f / F_n = 1892.669 / 2986.665 = 0.6337 \text{ (No units)}$$

## Friction Inclined

Tuesday, 6 March 2012  
7:33 PM

Q20: Incline angle  $A=32$  degs, mass= $283$  kg. Coefficient of friction= $0.19$ . What Force  $B$  is needed to pull it up the ramp?

$$W = 283 * 9.81 = 2776.23 \text{ N}$$

Components WRT surface:

$$F_p = W \sin(\theta) = 2776.23 * \sin(32) = 1471.178 \text{ N}$$

$$F_n = W \cos(\theta) = 2776.23 * \cos(32) = 2354.377 \text{ N}$$

$$F_f = \mu F_n = 0.19 * 2354.377 = 447.3316 \text{ N}$$

Force balance in the parallel axis...

$$F_b = F_p + F_f$$

$$= 1471.178 + 447.3316 = 1918.5096 \text{ N}$$

## Ladder question

Tuesday, 5 March 2013  
8:13 PM

Q23: The foot of a 4.2m long ladder is B=1210 mm from the frictionless wall. If the COF is 0.21, how high (C) can he stand before the ladder will slip?

Angle of friction =  $\tan^{-1}(0.21) = 11.8598^\circ$

Force is at  $90 - 11.8598 = 78.1402^\circ$

Now we have 3 forces of known direction;

1. Friction force at  $79.7961^\circ$

2. Wall force at  $180^\circ$

3. Weight of man at  $270^\circ$

Solve using 3 force principle to find the position of the man, hence his height up the ladder.

Friction on the wall?  
 Using graphical method this is simply a  
 sloping line instead of horizontal.  
 Mathematically, it is rather annoying.

## Inclined everything

Tuesday, 6 March 2012  
8:10 PM

Q24: Incline angle  $A=34$  degs, angle  $B=23$  degs, mass=164 kg,  $F_1=1030$  N, coefficient of friction=0.6. What is the magnitude of normal force  $F_n$ ?

$$W = 164 * 9.81 = 1608.84 \text{ N}$$

1. Components compared to surface:

$$W_p = W \sin(\theta) = 1608.84 * \sin(34) = 899.6519 \text{ N}$$

$$W_n = W \cos(\theta) = 1608.84 * \cos(34) = 1333.789 \text{ N}$$

$$F_{1p} = 1030 * \cos(23) = 948.12 \text{ N}$$

$$F_{1n} = 1030 * \sin(23) = 402.453 \text{ N}$$

2. Normal (perp) Forces Balance

$$F_n + F_{1n} - W_n$$

We want normal force (so we can do friction)

$$F_n = -F_{1n} + W_n$$

$$= -402.453 + 1333.789 = 931.336 \text{ N}$$

3. Now do friction at interface

$$F_f = \mu F_n = 0.6 * 931.336 = 558.8016 \text{ N}$$

4. (EXTRA)

What is the net parallel force?

Force balance in the parallel...

$$-W_p - F_f + F_{1p}$$

$$= -899.6519 - 558.8016 + 948.12 = -510.3335$$

The force is too small to pull it up the hill when friction is fighting against it, so it will stay still.

Q24: Incline angle  $A=34$  degs, angle  $B=23$  degs, mass=164 kg,  $F_1=1030$  N, coefficient of friction=0.6. What is the magnitude of normal force  $F_n$ ?

Solve this using CAD shall we?

$$W = 164 * 9.81 = 1608.84 \text{ N}$$

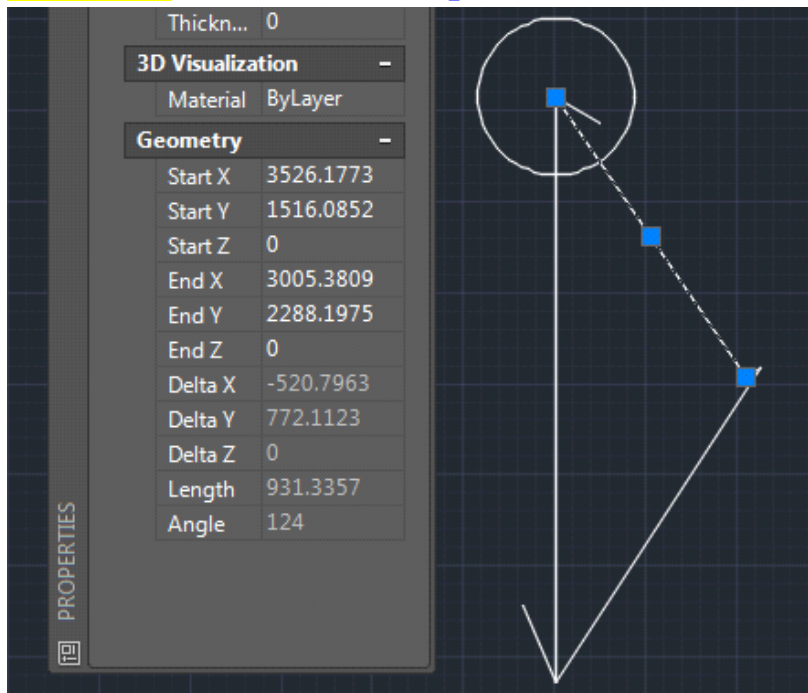

Total force of surface TO the block:

$$932.5961 \text{ N}$$

Friction of surface TO the block

48.4681 N down the slope  
Normal force of surface TO the block  
931.3357 N down the slope

# Great Eastern

Tuesday, 26 March 2013  
6:46 PM

## The launching of the Great Eastern 1857.

The Great Eastern was 6 times larger than any other ship when it was built. It was meant to slide down the launch ways and into the water. It got stuck. Several months later a series of hydraulic rams finally got it moving.

Q19: The Great Eastern was 12030 tonnes, and the hydraulic rams applied 3470 tonnes of force down the ramp. What was the coefficient of friction?

$$\text{Angle} = \arcsin(1/12) = 4.7802^\circ$$

Find  $F_n$ , then use  $F_f = \mu F_n$  to get  $\mu$ .

Components...

$$W_n = 12030 \times 1000 \times 9.81 \times \cos(4.7802)$$

$$= 1.17603 \text{ E8 N}$$

$$= 117603 \text{ kN}$$

$$W_p = 12030 \times 1000 \times 9.81 \times \sin(4.7802) = 9834.54 \text{ kN}$$

Force balance in parallel direction;

"Sum of all forces in Parallel direction = 0"

$$F_p + W_p - F_f = 0$$

$$F_f = F_p + W_p = 3470 \times 9.81 + 9834.54 = 43875.24 \text{ kN}$$

Now use  $F_f = \mu F_n$  to get  $\mu$ .

$$\mu = F_f / W_n = 43875.24 / 117603 = 0.3731$$
